Votaro is a very simple Esperanto dictionary that uses the original Votaro published by Zamenhoff at the turn of the 20th century, and is therefore quite old and out of date. It uses the original Zamenhoff dictionary, as you can see from the screenshot at the top of the page. However, it does provide all of the root words originally created by Zamenhoff and it shows translations in several languages. This is a personal project, and I'm the sole developer. It was created for those Esperantists who have a copy of the Zamenhoff dictionary, but who need a more practical tool for looking up Esperanto words. This was designed to be a light-weight and simple tool, and it currently is. Votaro uses the QT4 framework. It works with any system using the QT4 framework. This includes GNU/Linux, Windows (without MS Visual Studio, which is a large additional download), Mac OS X, BSD, and others. It can even run in emulators like Dolphin and other Android-based systems. It uses a SQLite database to store the actual dictionary. I hope this will change in the future. However, it would be fairly trivial to expand the SQL database to include a larger vocabulary. It is written in C++, using the QT4 framework, and uses a SQLite database to store the actual dictionary. It shows translations in several languages, and includes most of the words in the Zamenhoff dictionary. It shows all possible translations for each of the root words, and will give the right translation for every word used. If there is a word in the dictionary that can be used in multiple different ways, it will not show the same translation more than once. You can change the language you want to use by editing the DefaultLanguage file, which is stored in the Language/ directory. This can be done on the command line, using the Votaro command line tool. Votaro includes a built-in English to Esperanto translator. It uses the original Zamenhoff dictionary, as you can see from the screenshot at the top of the page. However, it does provide all of the root words originally created by Zamenhoff and it shows translations in <https://www.itchow.com/message/message.php?lang=en>
