PHP xdebug - A very powerful IDE with advanced profiling capabilities. BrowserKit - A tool for testing your webapps and databases in different browsers. Implementing the access control mechanism The solution provides many useful options that will make your life easier when implementing the access control mechanism. A6-group - A6 is a new group for pholder (access to authenticated and authorized users). Htpasswd - Contains a PHP function to create users in a passwordless fashion. Note: If you are using mod_rewrite for rewrite rules (RewriteRule), be sure that you used the apache2.conf variable ServerRoot to point to your folder where the php scripts can be found. This can be done easily by putting the following line in your apache2.conf file: ServerRoot "/path/to/websites" In addition, you need to tell the RewriteRules what the origin (Original URL) and the destination (New URL) where the RewriteRule should be applied is. The following two lines of code are very important in this case: If you use the above you will notice that the default value is enabled. What this means is that the first rule which is being applied for every request. This rule is applied by the appending request before the first rule. So
