Recently, a thermosensitive recording paper (hereinafter, a thermosensitive recording material) for recording image information by heating and printing with heat-sensitive ink is known to be a type of the multi-color printing. However, according to the thermosensitive recording material, a printing density depends on a thickness of the thermosensitive recording material. Thus, a printing density becomes inappropriate, as a case may be, when the thermosensitive recording material is thin and is printed on a large printed area. Moreover, in order to obtain the optimal printing density, it is necessary to melt the thermosensitive recording material to a certain extent or more in advance. On the other hand, if the thermosensitive recording material is thick so that the optimal printing density is obtained, there arises another problem that a heating and printing time becomes long. Thus, the thermosensitive recording material is difficult to put in practical use.The Wall Street Journal is reporting that the Trump administration is proposing to tighten use of the national security state in its fight against public protests. ---

Botnet The FSS Wannacry project is a project hosted by Ivan Pustogarov to gain reputation and build a live, working botnet. It is built for public display and education purposes and will be run on any friendly, public accessible computer that has Python installed. To build the FSS Wannacry, start by obtaining the FSS source and extract the Python version from the archive. This will build the Python scripts and dependencies needed for building and running the FSS botnet. Next, load the `fsswannacry_config.py` config file which lists the IP and port to listen on, and the `nvclock` scripts to create an `nvclock` configuration file. Then, you can run the build script and it will build the Wannacry botnet, which is called `wannacry.py`. From there, you can run it. I recommend running the FSS Wannacry on a laptop or desktop to use as a remote web proxy. `## Getting the FSS Botnet Source` The FSS Wannacry is still in private beta so you'll need to sign up on the ``Project Hosting Server`_` page to get the source. More information can be found in the documentation at ``Project Site`_`. You may also contact Ivan Pustogarov directly via ``GitHub`_`. `## Building the FSS Wannacry` To build the FSS Wannacry, first unzip the archive to a location. Open a terminal and `cd` into the directory. Next, load the `fsswannacry_config.py` config file which lists the IP and port to listen on, and the `nvclock` scripts to create an `nvclock` configuration file. Then, you can run the build script and it will build the Wannacry botnet, which is called `wannacry.py`. To run it, you must make sure that you are starting it on a port that isn't currently being used by anything. See ``Port Management``
