What does this mean for a Numpy array of real numbers such as y? Does this mean all values below the tth quantile are quantized to 0 and all values above the tth quantile are quantized to 1? A: The documentation for numpy.quantile(): y : array_like, shape (n,) Target array, for which quantiles are computed. So it is trying to find quantiles for all the values in your array. Then it will convert all the values below the quantile to 0 and all values above it to 1. What that means for your array of real numbers is, if your real number numpy array is called a: import numpy as np a = np.array([1.8, 2.5, -1.7, 3.3]) Then, you can get the lowest quantile from the array: >>> quantile(a, 0.2) array([0., 0., 0., 0.]) Then, you can get the highest quantile from the array: >>> quantile(a, 0.9) array([1. , 1.2, 0.8, 1.]) You can do the same for non-zero quantiles. Below the quantile: >>> quantile(a, 0.2, axis=0) array([[0., 0., 0., 0.], [0., 0., 0., 0.], [0., 0., 0., 0.], [0., 0.,

Am thinking about doing a new suspension on my Miata, anyone have experience with them? I would do the halibut brackets to be sure, but I have no idea how they'll fit under the stock bolts and diff. I don't have a plastic truss that I can use, if I decide to go with a frame rail for the vertical. Also, I don't have a driver and would need to get something else to hold the standard springs installed. I haven't found anything that comes close to fitting in most trim lines.Thanks,Mike X2 for the suggestion, thanks. I'll have to check eBay. I'm not sure if the standard springs will fit, my back seat seems to be a little high and extended. My OEM was a bit long and the SFB was a bit short with the springs, I have no problem with the current height. The springs didn't have the mounting hole in the middle, they were just a flat piece of steel. I guess the one I have I can get 'off the shelf' but I don't like the $110 price tag. e79caf774b
