
parts of the code? I've tried creating an instance in a separate class but it makes that class to inherit an Interface and not the Foo class but how can I create it in the Main class? A: Creating the interface in a separate class is the right way to do it. You can include your main class, create the instance of it using `Activator.CreateInstance()` method and assign it as an instance of that interface. Q: How do I make my PHP form GET values? When I'm trying to get `$_GET` with `echo $_GET['name'];` I get nothing, but when I'm using the PHP redirect function to echo the `$_GET['name']` I can see the value.

```
$form = "
```
