Features AutoCAD is a type-in, rule-based, and parametric CAD application. Parametric means that the user can establish a model on the computer screen and then move and rotate the object (building, device, etc.) as desired. You can rotate the object even after the drawing has been saved in the default drawing format (DWG). You also can translate an object (move it) as desired. The parametric model allows the user to create a building that can be expanded to any desired size. It is flexible in that it allows the user to design different types of buildings and modify their size, shape, and position easily. You can even change the orientation of the building to make the building more aesthetic. You can type in the dimensions, including the width, height, depth, and area, of the building. Dimensions are automatically taken into account when modifying the building. For example, you can type in 20 feet for the height, but if you make the building's height 20.5 feet, then the dimensions are automatically adjusted. The width can also be type in. The building's area can be type in as well. The area of the building is automatically adjusted when changing its height and width, and vice versa. A built-in feature allows the user to type in a base area (square footage) of a building. The base area represents the minimum area that the building must occupy. The building can be of any shape. You can draw a building with rounded corners. If you type in the base area of the building, then the minimum area of the building is specified. The building's dimensions can be changed freely. You can change a dimension by simply typing in the new value. For example, you can change the base area (of a square building) by typing in a number between 100 and 400. The computer reads the number and then changes the building's base area to that number. Built-in, graphical filters automatically apply effects to the building, such as lighting, shadows, highlights, coloring, and perspective. You can easily modify the appearance of the building by clicking on the various "brushes" used to apply the effects. AutoCAD uses the building block system, which is similar to a tiling system used in building construction. The building block system allows the user to change the shape of the building to create different shapes, as well as to create new shapes by expanding the existing ones. The block system can be expanded
